Abstract

Distributed Denial of Service (DDoS) attacks continue to plague the Internet. Defense against these attacks is complicated by spoofed source IP addresses. This makes it difficult to determine a packets true origin. Path Identifier (Pi) is a new packet marking approach with embeded path

The Pi has many unique features. It is per-packet deterministic mechanism: each packet traveling along the same path carries the same identifier. This allows the victim to take a proactive role in defending against a DDoS attack using the Pi mark to filter out packets matching the attackers identifiers on a per packet basis.

1 Introduction **1**

2 Literature Survey **2**

3 Project Statement **3**

4 System Requirement and Specification **4**

5 Planning and Scheduling **5**

6 Implementation **6**

7 Schedule of Work **7**

8 Conclusion **8**

References **9**

Appendix **10**

Chapter 1

Introduction

Chapter 2

Literature Survey

Chapter 3

Project Statement

Chapter 4

System Requirement and Specification

Chapter 5

Planning and Scheduling

Chapter 6

Implementation

Explain Implementation details : Experimental setup Scenarios, Testing, Results, Analysis, Graphs, Comparison with earlier work

Also add Screen shots and Code sample here.

Write in detail about the Testing Tools used (i.e. it's purpose in this project etc.) and Test plans executed and snapshots of the testing performed.

Chapter 7

Schedule of Work

Should be produced by making using of MS Project.

Chapter 8

Conclusion

Appropriate conclusion must be written with respect to the results and analysis that is performed in the last chapter

References

Appendix

if any write here.
